

THE STATE UNIVERSITY OF ZANZIBAR (SUZA)
SCHOOL OF COMPUTING COMMUNICATION AND MEDIA

STUDIES

DEPARTMENT OF COMPUTER SCIENCE AND INFORMATION TECHNOLOGY

COURSE NAME

HUMAN RESOURCE MANAGEMENT AND INFORMATION SYSTEMS

COURSE CODE **INF 3108**

NAME OF STUDENT	REGISTRATION NUMBER
FAUZIA MOHAMED ALI	BITAM/11/23/081/TZ
ALUWIYA GHARIB ABDULLAH	BITAM/11/23/066/TZ

INTRODUCTION

The Personnel Administration Data System (PADS) is the main digital tool used for modern Human Resource (HR) management. In the past, companies kept all employee records in physical paper files. Today, companies are moving away from paper and using centralized computer systems instead. PADS collects, stores, updates, and shares important employee information from the day a person is hired until the day they retire or leave the company. By keeping all data in one safe place, PADS stops mistakes, reduces manual work, and helps top managers make better business decisions.

Real-World Application

Imagine a large company with 2,000 workers distributed across different regions. In the old days, if an HR manager wanted to check a worker's past performance reviews or sick leave records, they had to walk to a storage room and search through big paper boxes. This took a lot of time, and files could easily get lost. With PADS, the manager can simply type the worker's name into a computer dashboard and see their entire work history instantly. This fast process makes it easy to run payroll and manage the workforce daily.

OBJECTIVE OF PAD

➤ Keeping Accurate Employee Records

The primary goal of PADS is to make sure that employee data is always correct and up to date. Information about workers changes all the time because people move to new houses, get new degrees, or change their phone numbers. PADS provides a central database where these changes are updated immediately, ensuring that other office systems do not use old or wrong information. Example If a senior accountant gets married and changes their last name, the HR officer updates this name inside PADS. Because the system is connected to everything, the name is automatically updated on the company's health insurance platform and the bank system. This ensures their next monthly salary goes to the correct bank account without any delays.

➤ Supporting and Standardizing HR Processes

To be fair and efficient, an organization must follow the same rules for every worker when dealing with promotions, job transfers, or terminations. PADS automates these steps. When an HR manager changes an employee's status in the system, PADS guides them through fixed

steps that follow company policy, removing personal bias and paperwork. Example If a company decides to promote an employee from "Sales Officer" to "Sales Manager," the HR executive enters this change into PADS. The system instantly updates the person's job level, increases their salary scale, gives them access to manager-only computer files, and updates the company's official organizational chart automatically.

➤ Managing Employee Welfare and Benefits

Employee compensation is not just about monthly salaries; it also includes health insurance, pension funds, and different types of leave (like sick leave or annual leave). PADS automatically calculates and tracks these benefits based on corporate rules and local labour laws, which saves the HR team from doing heavy manual math. Example When an employee applies for maternity leave through the PADS online portal, the system instantly checks how long she has worked for the company. It calculates the exact number of paid days off she is allowed to take, adds the dates to the department calendar, and tells the payroll system to keep paying her basic salary while pausing her transport allowances during her absence.

➤ Generating Critical Management Reports

Raw data is not helpful if it is scattered and hard to read. PADS acts as an information engine that gathers daily operational numbers and turns them into clean, structured management reports. These reports show clear trends about the workforce, helping executives plan corporate budgets and pass government audits. Example At the end of every month, PADS can generate an automatic "Staff Turnover Report". If the report shows that 15% of the workers in the technology department resigned within the last month, top executives can see this pattern immediately and investigate why that department is losing workers.

➤ Safeguarding Confidential Information

Employee files contain highly private data, such as bank accounts, home addresses, performance grades, and medical reports. PADS protects this sensitive information by using high-level security features like secure passwords and specific user access levels. This ensures that people can only see the data they need to do their specific job. Example In a typical corporate office, a general staff member can only log in to see their own profile and request leave days. If a low-level supervisor tries to log in to view the private salary history or medical records of a manager in another department, PADS blocks them immediately and alerts the security team.

➤ Enhancing Strategic Decision-Making

Beyond daily office work, PADS gives top leadership the long-term data they need to plan for the future of the company. It helps them see what skills the organization will need in the future, where they are spending too much money, and how to replace old workers who are getting ready to retire. Example During an annual business planning meeting, the board of directors requests a PADS report which reveals that 40% of their top infrastructure engineers will reach retirement age within the next three years. Because they see this data early, the board approves an immediate budget to recruit and train young apprentices to learn from the seniors before they leave.

RELATIONSHIP WITH OTHER SYSTEM

PADS do not work alone; it sits at the centre of the HR department and shares data smoothly with other specialized systems:

➤ Payroll Systems

PADS holds the master data for employee salaries, job grades, and tax categories. When an employee is promoted or takes unpaid leave inside PADS, the payroll system reads this information during the end-of-month cycle and calculates the net pay automatically, avoiding manual double-entry mistakes.

➤ Placement Systems

This system makes sure that new hires and transferred workers are put into the right roles based on their talents. When a new person is hired, PADS sends their university degrees and skill scores directly to the placement module, which suggests the best department or office location for them.

➤ Personnel Action Systems

This system logs major career updates and movements. For instance, when a worker resigns or is terminated, PADS records the action immediately, tells the IT department to close their corporate email account, and instructs the payroll system to calculate their final exit package.

➤ Benefits Administration

This module manages ongoing welfare programs like health insurance schemes and retirement accounts. PADS tracks how many years an employee has served, ensuring that when they finally retire, their total pension fund is calculated perfectly and paid out on time.

TYPE OF PADS

Depending on what an organization needs to focus on, PADS is divided into three main operational frameworks:

- **Personnel Status Reporting Framework**

This type focuses entirely on providing general workforce numbers and organizational chart layouts. It gives managers a real-time count of total employees, the balance between male and female workers, and a list of available skills in the company.

- **Personnel Action Processing Framework**

This type is built to handle constant everyday updates and worker movements. For example, if a worker is transferred from an office in Dar es Salaam to a branch in Zanzibar, this system updates their new physical location, changes their regional allowances, and assigns them to their new manager.

- **Fringe Benefits Administration Framework**

This type handles employee welfare, health insurance covers, and medical claims. It matches medical bills against the worker's insurance limits to prevent fraud and ensures that employees get refunded quickly when they pay for health services using their own money.

KEY FILE IN PADS

An efficient PADS system organizes its database into five main files or tables:

- **Employee Master File**

This is the most important file. It holds all the personal and professional details of every single worker, including national identity numbers, home addresses, tax codes, university degrees, and past performance ratings.

- **Job/Position File**

This file lists all the jobs available in the company, even if nobody is currently doing them. It stores official job titles, clear job descriptions, salary grades, and the required qualifications for each role.

➤ Job Applicants File

This file tracks the recruitment process. It stores the resumes, interview scores, background check reports, and selection status of every person who has applied for a job at the company.

➤ Accident/Incident File

This is a safety registry. It records all health and safety issues that happen at work, including workplace injuries, witness statements, and the details of insurance money paid to injured workers.

➤ Claims File

This file acts as a financial book for staff requests. It tracks, checks, and processes employee claims for money, such as daily travel allowances or long-term retirement pension payouts.

DATA ACCESS AND STORAGE

On the technical side, PADS uses a Relational Database Management System (RDBMS). Instead of saving data in messy, separate documents, information is neatly organized in tables that are linked together using a unique code, such as an Employee.

This database design allows HR workers to perform fast searches. For example, an HR worker can search for "all active employees who speak Swahili, have an IT degree, and have worked here for more than 5 years," and the system will show the list instantly. Also, PADS uses automated backup systems to save data in secure cloud servers every day, ensuring no important information is lost if a computer breaks down.

IMPORTANCE AND BENEFIT OF PADS

➤ Reduced Paperwork

Moving from paper records to PADS saves an enormous amount of physical office space and file maintenance time. Instead of buying large metal filing cabinets and spending money on paper, printing, and pens every year, the organization stores all data digitally on secure servers. This keeps the office neat and lowers administrative costs.

➤ Improved Operational Efficiency

PADS automates routine daily activities, which cuts down delays caused by manual work and waiting for signatures. For example, calculating monthly salaries, tracking absent days, and processing leave requests used to take HR departments several days of manual work. With PADS, these tasks are completed accurately within a few hours.

➤ **Guaranteed Legal Compliance**

PADS has local labour laws, national tax rates, and government reporting rules built directly into its system formulas. Because of this, the system automatically creates correct tax reports and social security logs for government agencies. This ensures the company pays its statutory dues on time and stays safe from heavy legal fines.

➤ **Proactive Workforce Planning**

The system gives corporate leaders a clear view of talent trends, skills gaps, and upcoming retirement dates across all departments. This early visibility means the HR team does not have to wait until a crisis happens. They can notice early when a critical department is losing workers and launch targeted recruitment or training programs in advance.

➤ **Systemic Error Reduction**

Human beings easily make typos and math mistakes when copying numbers by hand. PADS removes this danger by using automated validation rules and calculation formulas. This prevents expensive mistakes in sensitive areas, such as overpaying an employee's overtime hours or calculating leave days incorrectly.

CONCLUSION

The Personnel Administration Data System (PADS) is an essential cornerstone for modern, professional human resource management. By linking vital employee data with operational tools like payroll, talent acquisition, and benefits management, PADS changes HR from a slow, paper-heavy office into a fast, strategic asset. The explanations and real-world examples in this assignment clearly prove that PADS stops everyday mistakes, keeps companies compliant with national labour laws, and provides clear data to help managers plan for the future. As business settings continue to adopt digital technology, using a strong PADS is no longer just a luxury it is a mandatory requirement for long-term organizational success.
